

Cooler Weather = Less Irrigating

As we say goodbye to summer days and begin to experience the cooler temperatures of the fall and winter months, you have probably noticed your lawn is growing much slower, which means it requires less water. This time of year is a great time to cut back on your water use. Train your yard to need less water by irrigating only when your lawn begins to show signs of stress.

Signs of stress include:

Lingering footprints.

Grass blades folding in.

The top few inches of soil feeling dry.

Turn off your irrigation system, and irrigate only when you observe signs of stress in your lawn. This will encourage deeper root growth, which helps develop a more drought tolerant lawn and landscape that is less susceptible to diseases, pests, and weeds.
